Intro to 7.3- Solving systems using Matrices Period: \_\_\_\_\_ Date: \_\_\_\_\_

For each of the problems, define the variables you would use and set up a system using those variables to solve the problem.

- 1.) Avery and Mead went to an office supplies store to buy paper clips and pencils. Avery bought 15 boxes of paper clips and 7 packages of pencils, while Mead bought 12 boxes of paper clips and 10 packages of pencils. If Avery spent \$55.40 and Mead spent \$61.70, how much does a box of paper clips and a package of pencils cost?

Define variables: x: paper clips  
y: pencils

System:

$$\begin{aligned} 15x + 7y &= 55.40 \\ 12x + 10y &= 61.70 \end{aligned}$$

- 2.) Two angles are complementary. One angle is  $81^\circ$  less than twice the other angle. Find the measure of each angle.

Define variables: x: 1<sup>st</sup> angle  
y: 2<sup>nd</sup> angle

System:

$$\begin{aligned} x + y &= 90^\circ \\ x &= 2y - 81^\circ \rightarrow x - 2y = -81^\circ \end{aligned}$$

- 3.) Margie needs to buy a week's supply of medication for 24 dogs and 164 cats at a local shelter. The medication for each dog costs twice as much as the medication for a cat. If her budget is \$4,240, how much can Margie spend on medication for each dog?

Define variables: d = dogs  
c = cats

System:

$$\begin{aligned} 24d + 164c &= 4240 \\ d &= 2c \rightarrow d - 2c = 0 \end{aligned}$$

- 4.) Farmer Bob houses a total of 13 pigs and chickens. A total of 40 feet can be counted among these pigs and chickens. How many of the animals are pigs, and how many are chickens?

Define variables:  $P$ : pigs  
 $C$ : chickens

System:  $P + C = 13$   
 $4P + 2C = 40$

- 5.) Seventy-eight tickets were sold for a private Taylor Swift concert. If \$483 was collected and seats cost either \$2.50 or \$10.50, how many of each were sold?

Define variables:  $C$ : cheap seats  
 $E$ : expensive seats

System:  $C + E = 78$   
 $2.50C + 10.50E = 483$

- 6.) During a trip to the gas station you fill your vehicle with 15 gallons of premium gasoline and a 5 gallon gas can with regular gasoline. The price of premium gasoline is 25 cents greater than the price of regular gasoline. If you pay a total of \$76.75, what is the price per gallon of regular and premium gasoline?

Define variables:  $P$ : premium price  
 $R$ : regular price

System:  $15P + 5R = 76.75$   
 $P = R + 0.25$
