

# Solving Systems of Linear Equations

## Three Different Types of Solutions

an ordered pair that satisfies both equations

One Solution

$(x, y)$

No Solutions

$0 \neq -3$

Many Solutions

$0 = 0$

### Substitution Method

1.)  $-3x + 2y = -3$

$$2x - y = 3$$

$$2x = 3 + y$$

$$2x - 3 = y$$

$$-3x + 2(\quad) = -3$$

$$-3x + 2(2x - 3) = -3$$

$$-3x + 4x - 6 = -3$$

$$x - 6 = -3$$

$$x = 3$$

$$(3, 3)$$

① Get one variable in one equation alone

② Substitute in to the other equation

③ Plug in to any original equation

$$2(3) - y = 3$$

$$6 - y = 3$$

$$-y = -3$$

$$y = 3$$

### Elimination Method

2.)

$$-2(2x + 4y = -1)$$

$$4x - 3y = -2$$

$$+ \quad -4x - 8y = 2$$

---

$$\frac{-11y}{-11} = \frac{0}{-11}$$

$$2x + 4(0) = -1$$

$$2x = -1$$

$$x = -1/2$$

$$(-1/2, 0)$$

① Pick one variable and get the same # but opposite signs

② Add

$$y = 0$$

③ Plug it in
